

PRIVATE COURSE SINCE 2004

Scrum for Teams: Learning Objectives

This is a loose map from Exploring Scrum: The Fundamentals, second edition, Dan Rawsthorne with Doug Shimp. Delivery is shaped to the client's organization and the need of their teams. Completing the course does not confer a credential.

The listed items are the ground, not a contract. Sequencing, examples, and depth follow this application. Do not treat the book table of contents as the syllabus.

How this map is used

3Back's original course, taught since 2004. Foundational then. Still the right ground now. The book is the source. The course uses it on your work.

Learning approach: This document applies the learning model described in How 3Back Approaches Learning, 3Back, September 2026.

ADD-ON, NOT FROM THE BOOK

A Scrum team now works with AI as a tool and as a team member. That is part of the team's operating conditions and state. A course that leaves it out misses the point. The 2013 book does not say this. The add-on is current practice, taught against your work.

PEOPLE

Who is on the team

- 1.1 Describe the Scrum Team as a small group that produces results for stakeholders in this organization's work.
- 1.2 Distinguish on-team roles from people outside the team: Business Owner, Stakeholders, and Subject Matter Experts.
- 1.3 Explain Product Owner accountability for value and for ordering work the team can actually take.
- 1.4 Explain ScrumMaster work as coaching the team and honoring real constraints, not managing the team's work.
- 1.5 Describe swarming and self-organization as they would have to operate in this application.
- 1.6 Name who sits outside the team and how those people get a result without becoming a second Product Owner.
- 1.7 Add-on, not from the book. Treat AI as a tool and as a team member. Treat it as part of the team's operating conditions and state.

PRODUCT

What the work is

- 2.1 Say what product means in this application, not as a generic software example.
- 2.2 Describe how a backlog is ordered toward value here, and what visibility stakeholders actually get.
- 2.3 Distinguish a story the team can agree to do from an epic it cannot yet own.
- 2.4 Explain technical debt as unfinished or careless work that will constrain the next increment.
- 2.5 Use a story agreement the team can own: what done has to mean in this work.
- 2.6 Separate work that moves the product from chores that only keep the system running.
- 2.7 Add-on, not from the book. Say what done means when AI output is in the increment.

PRACTICES

How the team inspects and adapts

- 3.1 Plan a sprint by agreement inside the team, not by assigning tasks from outside it.
- 3.2 Use Planning Day as review, retrospective, and planning against this organization's calendar and constraints.

- 3.3 Run the daily as a working inspection of the stories, not a status meeting.
- 3.4 Adjust sprint content when the goal changes, the work will not fit, or new work has to be negotiated.
- 3.5 Make progress visible without theater: what is done, what is not, and what that means for the next decision.
- 3.6 Decide which practices from the book apply here, and which would be costume in this context.
- 3.7 Add-on, not from the book. Inspect AI-touched work in the same events the team already uses.

What this document is not

Not a credential checklist. Not a public seat syllabus. Not a module-unlock path. Not Exploring Scrum reproduced as a course outline. Optional extra half-day covers applied practice, mapping, and context so the work can take root. That half-day uses the same map.
